

Food Delivery

HARLEEN KAUR

OBJECTIVES

1

Transform and clean data to prepare it for analysis.

2

Visualize data effectively using charts and graphs for clarity.

3

Apply good design practices to create an easy-to-understand dashboard.

4

Integrate slicers, cards, and charts to provide a quick and interactive snapshot of the data.

DASHBOARD DESIGN

- ▶ A Bar Chart compares totals like orders or revenue by category, while a Line Chart shows trends over time. Maps visualize deliveries by area, and Pie or Donut Charts display percentages of orders by category. Tables provide detailed data, and KPI Cards highlight key metrics. To create these visuals, I imported the data, and select a visual type, and drag fields into the chart. Filters help me customize the view for focused analysis. These visuals make it easy to spot patterns and trends in the data.

FEEDBACK

- ▶ I received feedback on my Power BI dashboard. My peers liked the order volume by hour line chart and in the card visual of profit per order to change it and I changed it and replaced with a count of customer id. I tried to solve the problem with that but I think this is good than that.

THANK YOU
